RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 272 pages. Dimensions: 9.7in. x 7.4in. x 0.6in. This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1907 edition. Excerpt: . . . saving to be effected must be by utilising reserve plant at an equally favourable load; but to do this the restriction must not only be as to the hours overlapping, but also in the event of breakdown of plant. This restriction I cannot conceive to be acceptable to any consumer, no matter how accommodating he may be to the ideals of the station engineer. To my mind the whole argument must be in the question, Can we reasonably hope to find a class of consumer who is willing to accept supply only at such time as it is convenient for the undertakers to give it If so, then I for one am willing to consider the question of giving such a supply at a price equivalent to the value of the load obtained, which would certainly not be based on Mr. Taylors system of calculation. And the return I should expect from such an ideal consumer would be the actual running cost, plus capital charges for service connections, establishment charges, and the due proportion of the annual surplus required for reserve fund. However, I think the probability of obtaining this class of supply is so remote that I do not think it is worth the time required to discuss it, but I should like to remark briefly on one or two of the definitions used in the paper. Plant Load Factor. --As the station load factor is the index to the standing charges per...
